On May 11, 2023, the U.S. Environmental Protection Agency (EPA) proposed new carbon pollution standards for coal and gas-fired power plants. The proposal sets limits for new gas-fired combustion turbines, existing coal, oil, and gas-fired steam generating units, and certain gas-fired combustion turbines. The proposed new source performance standards (NSPS) and emission guidelines reflect the application of the best system of emission reduction (BSER). In determining BSER, the EPA considers costs, energy requirements, and other statutory factors, and must ensure that the technology has been adequately demonstrated to improve the emissions performance of the covered electric generating units. Notes: BSER = best system of emission reduction; CCS = carbon capture and sequestration. The proposed definition of “low-GHG hydrogen” is hydrogen produced with less than 0.45 kg CO₂ e/kg H₂ overall well to gate emissions. ### PROPOSED BSER LEVELS FOR 111(B)—NEW STATIONARY COMBUSTION TURBINES

<table>
<thead>
<tr>
<th>Phase I</th>
<th>Phase II Beginning in 2032–2035</th>
<th>Phase III Beginning in 2038</th>
</tr>
</thead>
</table>
| **Low Load Subcategory (Capacity Factor <20%)** | BSER: Use of low emitting fuels (e.g., natural gas and distillate oil)  
*Standard:* From 120 lb CO₂/MMBtu to 160 lb CO₂/MMBtu, depending on fuel type | No proposed Phase II or Phase III BSER component or standard of performance |
| **Intermediate Load Subcategory (Capacity Factor 20% to ~50%*)** | BSER: Highly efficient simple cycle generation  
*Standard:* 1,150 lb CO₂/MWh-gross | BSER: Continued highly efficient simple cycle generation with 30% (by volume) low-GHG hydrogen co-firing beginning in 2032  
*Standard:* 1,000 lb CO₂/MWh-gross | No proposed Phase III BSER component or standard of performance |
| **Baseload Subcategory (Capacity Factor >~50%*) *Limit** | BSER: Highly efficient combined cycle generation  
*Standard:* 770 lb CO₂/MWh-gross (EGUs with a baseload rating of 2,000 MMBtu/h or more)  
*Standard:* 770 lb–900 lb CO₂/MWh-gross (EGUs with a baseload rating of less than 2,000 MMBtu/h) | Low-GHG Hydrogen Pathway BSER:  
Continued highly efficient combined cycle generation with 30% (by volume) low-GHG hydrogen co-firing beginning in 2032  
*Standard:* 1,000 lb CO₂/MWh-gross | CCS Pathway BSER: Continued highly efficient combined cycle generation with 90% CCS beginning in 2035  
*Standard:* 90 lb CO₂/MWh gross |

### PROPOSED BSER LEVELS FOR 111D—EXISTING COAL, OIL, AND NATURAL GAS-FIRED BOILERS AND LARGE, FREQUENTLY USED NATURAL GAS COMBUSTION TURBINES

<table>
<thead>
<tr>
<th>Coal-Fired Boilers</th>
<th>Natural Gas and Oil-Fired Boilers</th>
<th>Natural Gas Combustion Turbines</th>

| For units operating past Dec. 31, 2039:  
**BSER:** CCS with 90% capture of CO₂ (88.4% reduction in emission rate) | BSER: Routine methods of operation and maintenance with an associated degree of emission limitation of no increase in emission rate (lb CO₂/MWh-gross). | For turbines of more than 300 MW, and a capacity factor of more than 50%:  
**CCS Pathway BSER:**  
By 2035: highly efficient generation coupled with CCS with 90% capture of CO₂ (90 lb CO₂/MWh) |
| For units that cease operations before Jan. 1, 2040, and are not in other subcategories:  
**BSER:** Co-firing 40% (by volume) natural gas with emission limitation of a 16% reduction in emission rate (lb CO₂/MWh-gross basis) | **Low-GHG Hydrogen Pathway BSER:**  
By 2032: highly efficient generation coupled with co-firing 30% (by volume) low-GHG hydrogen (680 lb CO₂/MWh) |  
*Low-GHG Hydrogen Pathway BSER:*  
By 2038: highly efficient generation coupled with co-firing 96% low-GHG hydrogen (90 lb CO₂/MWh) |
